Testing Document

Made a stress test suit, that tests both the Java's collections in the system and my own collections. Check the Userguide in the Documents folder for information on how to run the test suit.

The test results are written in a log file for comparing.

One interesting thing I found out, was that running the program with Git Bash for windows (a linux terminal) my own collections worked much faster, but when running in CMD the Java's collections were much faster.
